

[FAN MODULE]

Abstract

A fan module is disclosed. The fan module comprises a casing, a fan and a plurality of fins. The casing has a mounting space, an air inlet and an air outlet. The air inlet and the air outlet are linked through the mounting space. The fan is installed inside the mounting space. The fins are installed across the air outlet with each fins aligned in parallel to each other. The fins have a plurality of protruding sections protruding from a surface of the fins. Neighboring fins are separated from each other through the protruding sections so that the fins altogether divide the air outlet into a plurality of slots whose width is less than or equal to 1mm.
